## FEBRUARY IS NATIONAL PET DENTAL HEALTH MONTH

Dental health is a very important part of your pet's overall health, and dental problems can cause, or be caused by, other health problems.

Your pet's teeth and gums should be checked at least once a year by your veterinarian for early signs of problems and to keep your pet's mouth healthy.

Have your pet's teeth checked sooner if you observe any of the following problems:

- Bad breath
- Broken or loose teeth
- Extra teeth or retained baby teeth
- Teeth that are discolored or covered in tartar
- Abnormal chewing, drooling, or dropping food from the mouth
- Reduced appetite or refusal to eat
- Pain in or around the mouth
- Bleeding from the mouth
- Swelling in the areas surrounding the mouth

Some pets become irritable when they have dental problems, and any changes in your pet's behavior should prompt a visit to your veterinarian. Always be careful when evaluating your pet's mouth, because a painful animal may bite. (Continued on next page)

## Causes of pet dental problems

Although cavities are less common in pets than in people, they can have many of the same dental problems that people can develop:

- Broken teeth and roots
- Periodontal disease
- Abscesses or infected teeth
- Cysts or tumors in the mouth
- Malocclusion, or misalignment of the teeth and bite
- Broken (fractured) jaw
- Palate defects (such as cleft palate)

Periodontal disease is the most common dental condition in dogs and cats – by the time your pet is 3 years old, he or she will very likely have some early evidence of periodontal disease, which will worsen as your pet grows older if effective preventive measures aren't taken. Early detection and treatment are critical, because advanced periodontal disease can cause severe problems and pain for your pet. Periodontal disease doesn't just affect your pet's mouth. Other health problems found in association with periodontal disease include kidney, liver, and heart muscle changes.

It starts with plaque that hardens into tartar. Tartar above the gumline can often easily be seen and removed, but plaque and tartar below the gumline is damaging and sets the stage for infection and damage to the jawbone and the tissues that connect the tooth to the jaw bone. Periodontal disease is graded on a scale of 0 (normal) to 4 (severe).

The treatment of periodontal disease involves a thorough dental cleaning and x-rays may be needed to determine the severity of the disease. Your veterinarian or a board-certified veterinary dentist will make recommendations based on your pet's overall health and the health of your pet's teeth, and provide you with options to consider.

## What is veterinary dentistry, and who should perform it?

Veterinary dentistry includes the cleaning, adjustment, filing, extraction, or repair of your pets' teeth and all other aspects of oral health care. These procedures should be performed by a veterinarian or a board-certified veterinary dentist. Subject to state or provincial regulation, veterinary technicians are allowed to perform certain dental procedures under the supervision of a veterinarian. (Continued on next page)

## FEBRUARY IS NATIONAL PET DENTAL HEALTH MONTH (CONTINUED)

The process begins with an oral exam of your pet's mouth by a veterinarian. Radiographs (x-rays) may be needed to evaluate the health of the jaw and the tooth roots below the gumline. Because most dental disease occurs below the gumline, where you can't see it, a thorough dental cleaning and evaluation are performed under anesthesia. Dental cleaning includes scaling (to remove dental plaque and tartar) and polishing, similar to the process used on your own teeth during your regular dental cleanings.

### Why does dentistry require anesthesia?

When you go to the dentist, you know that what's being done is meant to help you and keep your mouth healthy. Your dentist uses techniques to minimize pain and discomfort and can ask you how you are feeling, so you accept the procedures and do your best to keep still. Your pet does not understand the benefit of dental procedures, and he or she reacts by moving, trying to escape, or even biting.

Anesthesia makes it possible to perform the dental procedures with less stress and pain for your pet. In addition, anesthesia allows for a better cleaning because your pet is not moving around and risking injury from the dental equipment. If radiographs (x-rays) are needed, your pet needs to be very still in order to get good images, and this is unlikely without heavy sedation or anesthesia.

Although anesthesia will always have risks, it's safer now than ever and continues to improve so that the risks are very low and are far outweighed by the benefits. Most pets can go home the same day of the procedure, although they might seem a little groggy for the rest of the day.

### What can I do at home for my pet's oral health?

Prevention of the most common oral disease in pets consists of frequent removal of the dental plaque and tartar that forms on teeth that are not kept clean. Regularly brushing your pet's teeth is the single most effective thing you can do to keep their teeth healthy between dental cleanings, and may reduce the frequency or even eliminate the need for periodic dental cleaning by your veterinarian. Daily brushing is best, but it's not always possible and brushing several times a week can be effective. Most dogs accept brushing, but cats can be a bit more resistant. Patience and training are important.

There are many pet products marketed with claims that they improve dental health, but not all of them are effective. Talk with your veterinarian about any dental products, treats, or dental-specific diets you're considering for your pet, or ask your veterinarian for their recommendation.

### What about "anesthesia-free" dental cleanings?

The American Veterinary Dental College does not recommend dental cleanings without anesthesia because they do not allow cleaning or inspection below the gumline, where most dental disease occurs, and can result in injury to the pet or the person performing the procedure.
