Cats Beat the Heat

ACOC Pet Fair!

Ticks 101

HELP YOUR CAT BEAT THE HEAT THIS SUMMER!

Summer might just be my favorite season and I'm probably not alone. It's the best time of year for me to enjoy all sorts of fun outdoor activities. While cats tend to tolerate the heat a little better than dogs, and even prefer it (we've all seen a cat stretched out on a sunny windowsill), that doesn't mean that you should forget about feline heat risks this summer!

1. Never leave your kitty in the car

This may apply more to the canines, but if you have a vet appointment for your furry feline and decide to make a quick stop at the supermarket-- think again! It can take minutes – yes, MINUTES – for a pet to develop heat stroke with respiratory distress, seizures, organ failure or death. For more detail. Most people don't realize how hot it gets in parked cars. On a 78 degree day, for instance, temperatures in a car can reach 90 degrees in the shade and top 160 degrees if parked directly in the sun (Check out Dr. Ernie Ward's video to see for yourself!) If you are waiting curbside for your veterinary or boarding appointment, try to park in a shady spot and keep the air running until your appointment. Your best bet is to skip the recreational joy rides on warm days and leave your pet at home.

2. Keep your cat's water cool and fresh

Our cats get much thirstier than we do when they get hot, and other than drinking, they really have no way to cool themselves down, so be sure their water is always fresh. You can keep it cool by adding a couple of ice cubes as well.

3. Try whipping up some 'catsicles'!

Some what-sicles? CAT-sicles- popsicles for cats! What you'll need:

- 10-ounce plastic cups
- 5.5 ounce can of your cat's favorite wet food (smooth)
- Catnip and/or soft treats (optional)
- 1 small square of Saran Wrap

Once you have everything ready, start mixing your ingredients (if you decided to use treats as well, the mixture should look a lot of like cookie-dough). After you've mixed everything, fill the plastic cups about 1/4-1/2 an inch and flatten the mixture by stacking the cups. Place Saran Wrap over the top cup to avoid freezer burn and freeze overnight. The next morning, run the bottom cup under warm water until you can pull it off of the stack and pop out the mixture which should now be a nice, round catsicle! Place it in a deep bowl (to avoid messes) and let it stand until the outside starts to "sweat". Finally give the cool treat to your feline! Watch the video below to see how my crazy kitties enjoyed them! Remember, these calories count too, so if your pet has trouble maintaining a healthy body weight, please check with your veterinarian first.

4. Make sure they have a cool place to sit

While indoor cats have plenty of shade options, they love to sunbathe and direct sunlight can overheat them and cause heat stroke. Another idea is to give them a cool place to sit, kind of like a reverse heating pad. Freeze a water bottle, wrap it up (so it doesn't stick to their hair/skin), and place it under a lightweight blanket or towel in one of their favorite places to sit.

5. Open up some windows

Knowing cats love windowsills, always make sure your screens are fully secured before opening a window. You may want your house to be ventilated, but you definitely do not want your kitty to fall out!

6. Believe it or not, cats can sunburn!

Just like for people, sunburns can be painful for a cat and overexposure to the sun can lead to skin cancer. Most cats have hair that protects them from sun damage. However, hairless cats, like the Sphynx, are highly susceptible to sunburns, especially in areas like the ears, nose, lips, eyelids and belly. Talk to your veterinarian about sunscreens for your kitty (don't assume a sunscreen for people is appropriate for your cat).

ACOC PET FAIR

Saturday August 20th
1pm to 4pm

**ANIMAL CLINIC OF
CHARDON**

656 WATER ST. CHARDON OH

FREE ENTRY

BRING YOUR WELL-BEHAVED
DOG FOR LOTS OF FUN!

- pool paw-ty •
- win a Dyson Pet Vacuum •
- beach costume contest •
- demonstrations •
- food at Kiki's Snack Shack •
- live music - Carlito's Dream •
- dunk booth •
- games for kids •
- and much more!

OTHER TAGS A WHALE.

TICKS 101

Ticks spread disease

Ticks are more than just creepy; they can spread a number of different diseases that affect both pets and people. Ticks can transmit Lyme disease, Ehrlichia, Rocky Mountain Spotted Fever, anaplasmosis, tularemia, and babesia. So what can you do to protect your pets and your family from tick-borne diseases?

"An ounce of prevention is worth a pound of cure"

The best way to treat an illness is to prevent it in the first place. The same applies to tick-borne disease. Fortunately, there are numerous products available to prevent tick infestations. Topical and oral medications and medicated-collars are effective at keeping ticks away from your pets. Depending on where you live and your pet's risk factors, your veterinarian may also recommend additional protection like a vaccination for Lyme disease. Although these preventive measures are effective, it is important to note that none provide 100% protection.

Since no preventive treatment can be completely foolproof, it is still important to inspect your pet for ticks on a daily basis. Know what ticks look like, study up on the lifecycles of ticks, and give your pet a head-to-tail inspection. Your pet will love the extra attention and you might find a tick before it has a chance to spread disease. Since ticks need to be attached several hours to one or two days to spread most infection, prompt proper removal is critical to minimize the risk of disease transmission.

Signs and symptoms of tickborne illnesses

Ticks can spread a number of different diseases, so the signs and symptoms can vary depending on the disease. Some of the signs seen in several of these illnesses include: lethargy (loss of energy), loss of appetite, and lameness or reluctance to move. It is important to realize that more often than not the signs of a tick borne illness may be either very subtle or non-existent. In addition, many of the tick-borne illnesses mimic other diseases. Therefore it is best not to wait for symptoms to appear. If your pet has been exposed to ticks speak with your veterinarian immediately about screening tests and preventive products.

Screening tests

Screening tests are a fast and easy way to detect tick-borne diseases early when they are easier to treat. Many vets routinely include screening tests for tick-borne illnesses with their annual blood work. Check with your veterinarian just to be sure.

For more information about ticks, how to safely remove them and ways to protect your pets and your human family speak with your veterinarian and go to www.dogsandticks.com.
